

ChordDHT Node

Cloudflare Workers TypeScript 实现设计文档

版本	v1.0-CF · 草案
创建日期	2026 年 5 月 30 日
基于	ChordDHT Go 实现 v3.0 (v1.0 + v2.0 + v3.0 设计文档)
适用范围	学习用途
文档类型	技术报告
受众	技术开发者

目录

1. Cloudflare 服务选型与限制
2. 整体架构
3. 项目结构与 wrangler.toml
4. 核心数据结构 (TypeScript)
5. Durable Object: ChordNode 类
6. DO Alarm: 维护循环
7. HTTP 路由层 (Worker fetch handler)
8. Chord 协议算法实现
9. v2.0 身份验证: Web Crypto API
10. v3.0 优化实现
11. Tracker Client 实现
12. DO Storage 持久化策略
13. Graceful Leave: 适配 API 触发
14. 配置管理: Secrets 与环境变量
15. Go → TypeScript 逐项映射对照表
16. 已知约束与边缘情况

第 1 章 Cloudflare 服务选型与限制

1.1 使用的 CF 服务一览

CF 服务	用途	必须付费?
Durable Objects (DO)	每个 DO 实例 = 一个 Chord 节点，持有全部状态	❌ 免费计划已包含 (SQLite 后端)
DO Alarm	驱动 10s / 15s / 30s / 60s 周期维护，替代 Go <code>time.Ticker</code>	❌ 免费计划已包含
DO Storage (SQLite)	持久化 <code>fingerTable</code> 、 <code>successorList</code> 、 <code>predecessor</code> 、状态机	❌ 免费计划 1 GB
Workers	HTTP 路由层，将请求转发到对应 DO 实例	❌ 免费计划已包含
Workers Secrets	存储 <code>node_private_key</code> 、 <code>node_certificate</code> 、 <code>ca_public_key</code>	❌ 免费计划已包含
Worker Cron	不使用——DO Alarm 完全替代	—
Workers KV	不使用——节点状态用 DO Storage，无需 KV	—

1.2 关键限制清单（查证版）

限制项	免费计划	付费计划 (\$5/月)	对本项目的影响
DO CPU 时间 / 请求	30 ms	30 s	⚠️ 免费计划 30 ms 不够用 (Ed25519 验签约需 1-5 ms，批量 <code>k=8</code> 并发 <code>fix_fingers</code> 可能超限)；需付费计划
DO Alarm 最小间隔	无下限 (毫秒级)	无下限	✅ v3.0 的 10 s <code>fix_fingers</code> 周期完全可行
DO Alarm CPU 时间	30 ms	30 s	⚠️ 同上，同一 CPU 限制，付费计划 30 s 绰绰有余
DO Storage 容量	1 GB	10 GB	✅ 节点状态极小 (< 1 MB)
Worker subrequest 数 / 调用	50 次	1 000 次	⚠️ 免费计划 50 次对并行 <code>fix_fingers</code> 有影响；付费 1 000 次足够
Worker Cron 最小间隔	1 分钟	1 分钟	✅ 不使用 Cron，用 DO Alarm
DO 实例并发请求	串行 (单线程)	串行 (单线程)	✅ 天然消除所有 <code>sync.RWMutex</code>

⚠️ 结论：需要 Workers Paid 套餐 (\$5/月)

原因是免费计划 DO CPU 时间仅 30 ms，Ed25519 签名验证 + 业务逻辑 + 并发 `fetch` 的总 CPU 耗时会超限。付费计划 30 s CPU / 请求，完全足够。

第 2 章 整体架构

2.1 架构概览图

2.2 部署模型说明

每个 Worker deployment 对应一个 Chord 节点。节点之间通过 HTTPS 互相通信，节点 URI 即 Worker 的 `workers.dev` 子域名或自定义域名，与 Go 实现的 `https://hostname` 完全对应。

```
https://node-a.example.workers.dev → 部署 A (单个 DO 实例)
https://node-b.example.workers.dev → 部署 B (单个 DO 实例)

node_id_A = SHA1("https://node-a.example.workers.dev")
node_id_B = SHA1("https://node-b.example.workers.dev")
```

每个节点具有以下独立性：

- 独立的 `wrangler.toml` 配置
- 独立的 Secrets（私钥、证书）
- 独立的 DO 实例

第 3 章 项目结构与 `wrangler.toml`

3.1 项目目录结构

```
chord-node/
├── wrangler.toml

# Secrets (通过 wrangler secret put 设置, 不写在此处):
# NODE_PRIVATE_KEY_BASE64      Ed25519 私钥, 32字节, base64url
# NODE_CERTIFICATE_JSON        完整 JSON 证书字符串
# CA_PUBLIC_KEY_BASE64         CA 公钥, 32字节, base64url
# MANUAL_SEEDS                  JSON 数组字符串, 如 '["https://node-b..."]'

```

第 4 章 核心数据结构 (TypeScript)

以下为 `src/chord/types.ts` 的完整类型定义, 涵盖协议运行所需的全部接口与联合类型。

```

// src/chord/types.ts

export interface NodeInfo {
  node_id: string;           // 40位十六进制
  uri: string;               // 规范化 HTTPS URI
  status?: NodeStatus;
  joined_at?: string;        // ISO 8601 UTC
  certificate?: Certificate; // v2.0
  region?: string;           // v3.0
  version?: string;          // v3.0 "3.0"
  capabilities?: string[];    // v3.0
}

export type NodeStatus =

```

```

| "INITIALIZING"
| "JOINING"
| "ACTIVE"
| "LEAVING"
| "ISOLATED";

export type MaintenanceMode =
| "ACTIVE_MAINTENANCE"
| "QUIET_MAINTENANCE";

export interface FingerEntry {
  index: number;           // 0..159
  start: string;           // (self.id + 2^i) mod 2^160, 40位hex
  node: NodeInfo;
  status: "ok" | "suspicious" | "unknown" | "failed";
  lastVerified: number;    // Unix ms
  valid: boolean;          // v3.0: false 优先重修
}

export interface RoutingCacheEntry {
  targetId: string;
  resultNode: NodeInfo;
  cachedAt: number;        // Unix ms
  intervalStart?: string;  // predecessor.id (exclusive)
  intervalEnd?: string;    // resultNode.id (inclusive)
}

export interface RTTEntry {
  avgRtt: number;          // ms, EWMA  $\alpha=0.3$ 
  sampleCount: number;
  updatedAt: number;       // Unix ms
}

export interface Certificate {
  version: 1;
  node_id: string;
  uri: string;
  public_key: string;      // base64url, 32字节 Ed25519 公钥
  issued_at: number;       // Unix 秒
  expires_at: number;      // Unix 秒
  signature: string;       // base64url, 64字节
}

export interface CRL {
  version: 1;
  updated_at: number;
  revoked: Array<{ node_id: string; revoked_at: number; reason: string }>;
  signature: string;
}

export interface PersistedState {
  nodeId: string;
  uri: string;
  status: NodeStatus;
  joinedAt: string | null;
  predecessor: NodeInfo | null;
  predecessorList: NodeInfo[]; // v3.0, 长度2
  successorList: NodeInfo[];  // v3.0, 长度r=5
}

```

```
fingerTable: FingerEntry[];           // 160条
nextFingerIndex: number;
maintenanceMode: MaintenanceMode;
lastChangeTime: number;               // Unix ms, 用于ACTIVE/QUIET切换
maintenanceCycles: number;
region: string;
crl: CRL | null;
alarmScheduled: boolean;
}
```

4.1 类型结构说明

接口 / 类型	说明	版本引入
NodeInfo	节点基本身份信息，用于 finger table、successor list 等所有需要引用节点的场景	v1.0
NodeStatus	节点生命周期状态机，共 5 个状态	v1.0
MaintenanceMode	自适应维护模式（活跃 / 安静），影响 Alarm 触发频率	v3.0
FingerEntry	单条 finger 表项，含 valid 标志用于 v3.0 优先修复	v1.0 / v3.0
RoutingCacheEntry	路由缓存条目，支持区间命中优化	v3.0
RTTEntry	RTT 测量记录，使用 EWMA ($\alpha=0.3$) 平滑	v3.0
Certificate	节点身份证书，由 CA 签发，含 Ed25519 公钥	v2.0
CRL	证书吊销列表	v2.0
PersistedState	DO Storage 持久化的完整节点状态快照	v1.0

第 5 章 Durable Object：ChordNode 类

ChordNode 是整个系统的核心，位于 `src/chord-node.ts`。每个 DO 实例代表一个 Chord 节点，其单线程执行模型天然消除了 Go 实现中的所有 `sync.RWMutex`。

5.1 类骨架与内存状态

```
// src/chord-node.ts

import { DurableObject } from "cloudflare:workers";
import type { Env } from "../index";
import type {
  NodeInfo, NodeStatus, MaintenanceMode,
```

```

    FingerEntry, PersistedState
} from "./chord/types";
import { computeNodeId, normalizeUri } from "./chord/ring";
import { runMaintenanceCycle } from "./chord/maintenance";
import { AuthSigner } from "./auth/signer";
import { AuthVerifier } from "./auth/verifier";
import { RoutingCache } from "./cache/routing-cache";
import { NonceCache } from "./auth/nonce-cache";
import { CertCache } from "./auth/cert-cache";

export class ChordNode extends DurableObject<Env> {
    // — 运行时内存状态 (热路径, DO 单线程无需锁) —————
    private nodeId: string = "";
    private uri: string = "";
    private status: NodeStatus = "INITIALIZING";
    private joinedAt: string | null = null;
    private predecessor: NodeInfo | null = null;
    private predecessorList: NodeInfo[] = []; // v3.0, 长度2
    private successorList: NodeInfo[] = []; // v3.0, 长度r=5
    private fingerTable: FingerEntry[] = []; // 160条
    private nextFingerIndex: number = 0;
    private maintenanceMode: MaintenanceMode = "ACTIVE_MAINTENANCE";
    private lastChangeTime: number = 0;
    private maintenanceCycles: number = 0;
    private region: string = "unknown";
    private alarmScheduled: boolean = false;

    // — 内存缓存 (DO 驱逐后重建, 协议容忍) —————
    private nonceCache: NonceCache = new NonceCache();
    private certCache: CertCache = new CertCache();
    private routingCache: RoutingCache = new RoutingCache(256);
    private rttCache: Map<string, { avgRtt: number; sampleCount: number; updatedAt: number }> = new
Map();
    private maintenanceModeActive: boolean = false;

    // — 认证组件 (从 Secrets 初始化) —————
    private signer: AuthSigner | null = null;
    private verifier: AuthVerifier | null = null;
    private authEnabled: boolean = false;

    constructor(ctx: DurableObjectState, env: Env) {
        super(ctx, env);
        this.ctx.blockConcurrencyWhile(() => this.initialize());
    }

    // — initialize(): 从 DO Storage 恢复状态 —————
    private async initialize(): Promise<void> {
        // 1. 从 Storage 加载持久化状态
        const raw = await this.ctx.storage.get<PersistedState>("node_state");
        if (raw) {
            this.nodeId = raw.nodeId;
            this.uri = raw.uri;

    region: this.region,
    version: "3.0",
    capabilities: ["chord-v3"],
  };
}
}

```

第 6 章 DO Alarm：维护循环

核心机制说明

DO Alarm 是替代 Go `time.Ticker + goroutine` 的核心机制。节点自我续命：每次 `alarm()` 执行完后，调用 `setAlarm()` 设置下一次触发时间，形成永久循环，无需 Worker Cron 参与。

6.1 维护循环完整实现（src/chord/maintenance.ts）

```

// src/chord/maintenance.ts

import type { ChordNode } from "../chord-node";

```

```

import type { NodeInfo } from "./types";
import { inRange } from "./ring";

// — runMaintenanceCycle(): 主维护循环入口 —————
export async function runMaintenanceCycle(node: ChordNode): Promise<void> {
  const status = node.getStatus();

  // 1. JOIN 流程
  if (status === "INITIALIZING" || status === "JOINING") {
    await runJoinFlow(node);
    return;
  }

  // 2. ISOLATED 恢复
  if (status === "ISOLATED") {
    await runIsolatedRecovery(node);
    return;
  }

  // 3. ACTIVE 正常维护周期 (8步)
  if (status === "ACTIVE") {
    node.incrementMaintenanceCycles();

    // Step 1: check_predecessor
    await checkPredecessor(node);

    // Step 2: stabilize (每次均执行)
    await stabilize(node);

    // Step 3: fix_fingers (批量并行)
    const isActive = node.getMaintenanceMode() === "ACTIVE_MAINTENANCE";
    const batchSize = isActive ? 8 : 4;
    await fixFingersBatch(node, batchSize);

    // Step 4: 自适应维护模式切换
    const quietThreshold = 10; // 10次无拓扑变化 → QUIET
    const cycles = node.getMaintenanceCycles();
    const lastChange = node.getLastChangeTime();
    const now = Date.now();
    if (isActive && cycles > quietThreshold && (now - lastChange) > 120_000) {
      node.setMaintenanceMode("QUIET_MAINTENANCE");
    }

    // Step 5: 持久化 (仅当状态有变化时)
    await node.persistState();
  }
}

// — checkPredecessor(): v3.0 分层超时、快速崩溃检测 —————
export async function checkPredecessor(node: ChordNode): Promise<void> {
  const pred = node.getPredecessor();
  if (!pred) return;

  const region = node.getRegion();
  const predRegion = pred.region ?? "unknown";
  const sameRegion = region === predRegion;

  // v3.0: 同区域更短超时, 跨区域更长超时

```

```

const timeoutMs = sameRegion
  ? parseInt(node.env.HTTP_TIMEOUT_SAME_REGION_MS ?? "5000")
  : parseInt(node.env.HTTP_TIMEOUT_CROSS_REGION_MS ?? "15000");

try {
  const controller = new AbortController();
  const timer      = setTimeout(() => controller.abort(), timeoutMs);
  const resp = await node.rpcFetch(pred.uri + "/chord/ping", {
    method: "GET",
    signal: controller.signal,
  });
  clearTimeout(timer);

  if (!resp.ok) {
    node.markPredecessorFailed();
  }
} catch {
  // 超时或网络错误 → 前驱失效
  node.markPredecessorFailed();
}
}

// — stabilize(): 稳定化协议 —————
export async function stabilize(node: ChordNode): Promise<void> {
  const successorList = node.getSuccessorList();
  if (successorList.length === 0) return;

  let successor = successorList[0];

  // 1. 获取 successor 的前驱
  try {
    const resp = await node.rpcFetch(successor.uri + "/chord/predecessor", {
      method: "GET",
    });
    if (resp.ok) {
      const body = await resp.json<{ predecessor: NodeInfo | null }>();
      const x    = body.predecessor;

      // 2. 发现新节点插入: x 在 (self, successor) 区间内
      if (x && inRange(x.node_id, node.selfInfo().node_id, successor.node_id, false, false)) {
        successor = x;
        node.setSuccessorList([x, ...successorList.slice(0, 4)]);
        await node.onTopologyChange();
      }
    }
  } catch {
    // successor 无响应 → 切换到备用
    const backup = successorList.slice(1);
    if (backup.length > 0) {
      node.setSuccessorList(backup);
      await node.onTopologyChange();
    } else {
      node.setStatus("ISOLATED");
    }
    return;
  }
}

// 3. 发送 notify (告知 successor 自己可能是其前驱)

```

```

try {
  await node.rpcFetch(successor.uri + "/chord/notify", {
    method: "POST",
    body: JSON.stringify({ node: node.selfInfo() }),
    headers: { "Content-Type": "application/json" },
  });
} catch {
  // notify 失败不影响协议正确性
}

// 4. 刷新 successor_list
try {
  const resp = await node.rpcFetch(successor.uri + "/chord/successor-list", {
    method: "GET",
  });
  if (resp.ok) {
    const body = await resp.json<{ successorList: NodeInfo[] }>();
    const r = parseInt(node.env.SUCCESSOR_LIST_SIZE ?? "5");
    node.setSuccessorList([successor, ...body.successorList].slice(0, r));
  }
} catch {
  // 忽略, 保持现有列表
}
}

// — fixFingersBatch(): v3.0 批量并行修复 —————
export async function fixFingersBatch(node: ChordNode, batchSize: number): Promise<void> {
  const ft = node.getFingerTable();
  const selfId = node.selfInfo().node_id;
  const maxHops = parseInt(node.env.MAX_HOPS ?? "161");

  // 优先修复 valid=false 的条目, 其次按指数跨越顺序 (高位优先)
  const invalidIndices = ft
    .filter(e => !e.valid)
    .map(e => e.index)
    .sort((a, b) => b - a); // 高位优先

  const validIndices = Array.from({ length: 160 }, (_, i) => i)
    .filter(i => !invalidIndices.includes(i))
    .sort((a, b) => b - a);

  const priorityQueue = [...invalidIndices, ...validIndices].slice(0, batchSize);

  // 并行查询
  const tasks = priorityQueue.map(async (i) => {
    const start = ft[i].start;
    try {
      const result = await node.findSuccessorIterative(start, maxHops);
      node.updateFingerEntry(i, result, true);
    } catch {
      node.updateFingerEntry(i, ft[i].node, false);
    }
  });

  await Promise.allSettled(tasks);
}

```

第 7 章 HTTP 路由层（Worker fetch handler）

设计原则

Worker 层极薄——只做一件事：将所有请求转发给唯一的 DO 实例（名为 "singleton"）。这是因为每个 wrangler deploy 对应一个节点，整个 Worker 里只存在一个 Chord 节点 DO 实例。

7.1 完整实现（src/index.ts）

```
// src/index.ts

export interface Env {
  CHORD_NODE: DurableObjectNamespace;
  NODE_URI: string;
  NODE_REGION: string;
  TRACKER_URL: string;
  TRACKER_SEED_COUNT: string;
  AUTH_ENABLED: string;
  SUCCESSOR_LIST_SIZE: string;
  NODE_PRIVATE_KEY_BASE64: string;
  NODE_CERTIFICATE_JSON: string;
  CA_PUBLIC_KEY_BASE64: string;
  MANUAL_SEEDS: string;
}

export { ChordNode } from "../chord-node";

export default {
  async fetch(request: Request, env: Env): Promise<Response> {
    const url = new URL(request.url);
    const doId = env.CHORD_NODE.idFromName("singleton");
    const stub = env.CHORD_NODE.get(doId);
    return stub.fetch(request);
  },
} satisfies ExportedHandler<Env>;
```

7.2 路由设计说明

路径前缀	分类	说明
/chord/ping	协议接口（免认证）	存活探测，用于 checkPredecessor
/chord/info	协议接口（免认证）	返回节点基本信息
/chord/certificate	协议接口（免认证）	返回节点证书，用于验签
/chord/find-successor	协议接口（需认证）	迭代查找后继节点

路径前缀	分类	说明
/chord/predecessor	协议接口（需认证）	获取前驱节点，用于 stabilize
/chord/notify	协议接口（需认证）	通知前驱候选，用于 stabilize
/chord/successor-list	协议接口（需认证）	获取后继列表
/admin/join	管理接口	触发 Join 流程
/admin/leave	管理接口	触发 Graceful Leave
/admin/status	管理接口	查询节点运行状态
/admin/finger-table	管理接口	查看完整 finger 表
/admin/maintenance-mode	管理接口	手动切换维护模式

第 8 章 Chord 协议算法实现

8.1 160-bit 环形运算（src/chord/ring.ts）

```
// src/chord/ring.ts
// 所有 ID 均为 40 位十六进制字符串 (160 bit)，内部运算使用 BigInt

const RING_SIZE = 2n ** 160n;

export function hexToBigInt(hex: string): bigint {
  return BigInt("0x" + hex);
}

export function bigIntToHex(n: bigint): string {
  return n.toString(16).padStart(40, "0");
}

// 规范化 URI: 去除末尾斜杠, 转小写 scheme+host
export function normalizeUri(raw: string): string {
  const u = new URL(raw);
  return `${u.protocol}${u.hostname}${u.port ? ":" + u.port : ""}`;
}

// 计算节点 ID: SHA-1(uri)
export async function computeNodeId(uri: string): Promise<string> {
  const encoded = new TextEncoder().encode(uri);
  const hashBuf = await crypto.subtle.digest("SHA-1", encoded);
  return Array.from(new Uint8Array(hashBuf))
    .map(b => b.toString(16).padStart(2, "0"))
    .join("");
}
```

```

// 顺时针距离: 从 a 到 b 的顺时针弧长
export function clockwiseDistance(a: string, b: string): bigint {
    const ia = hexToBigInt(a);
    const ib = hexToBigInt(b);
    return ib >= ia ? ib - ia : RING_SIZE - ia + ib;
}

// inRange: id 是否在 (start, end] 区间内 (半开半闭, 顺时针)
export function inRange(
    id: string,
    start: string,
    end: string,
    startInclusive = false,
    endInclusive   = true
): boolean {
    const i = hexToBigInt(id);
    const s = hexToBigInt(start);
    const e = hexToBigInt(end);

    const afterStart = startInclusive ? i >= s : i > s;
    const beforeEnd   = endInclusive   ? i <= e : i < e;

    if (s < e) {
        return afterStart && beforeEnd;
    } else if (s > e) {
        // 跨越 0 点
        return afterStart || beforeEnd;
    } else {
        // s === e: 全环 (仅单节点情况)
        return true;
    }
}

// inRangeOpen: (start, end) 双开区间
export function inRangeOpen(id: string, start: string, end: string): boolean {
    return inRange(id, start, end, false, false);
}

```

8.2 find_successor 迭代模式 (src/chord/algorithms.ts)

```

// src/chord/algorithms.ts

import type { ChordNode } from "../chord-node";
import type { NodeInfo } from "../types";
import { inRange, clockwiseDistance, hexToBigInt } from "../ring";

// — localFindSuccessor(): 本地快速判断 —————
export function localFindSuccessor(node: ChordNode, targetId: string): NodeInfo | null {
    const self      = node.selfInfo();
    const succList  = node.getSuccessorList();
    if (succList.length === 0) return null;

    const successor = succList[0];

    // target 在 (self, successor] 区间内 → successor 即是答案
    if (inRange(targetId, self.node_id, successor.node_id)) {

```

```

    return successor;
  }
  return null;
}

// — computeScore(): v3.0 延迟感知路由评分 —————
// 综合评分 = ID接近度(0.6) + RTT分数(0.3) + Region亲和(0.1)
function computeScore(
  node: ChordNode,
  candidate: NodeInfo,
  targetId: string
): number {
  const dist      = clockwiseDistance(candidate.node_id, targetId);
  const maxDist   = 2n ** 160n;
  const idScore   = 1 - Number(dist * 1_000_000n / maxDist) / 1_000_000;

  const rtt       = node.getRtt(candidate.uri);
  const rttScore  = rtt === null ? 0.5 : Math.max(0, 1 - rtt / 1000);

  const region    = node.getRegion();
  const candRegion = candidate.region ?? "unknown";
  const regionScore = region === candRegion ? 1.0 : 0.0;

  return idScore * 0.6 + rttScore * 0.3 + regionScore * 0.1;
}

// — closestPrecedingNode(): v3.0 延迟感知, 综合评分选最优 —————
export function closestPrecedingNode(node: ChordNode, targetId: string): NodeInfo {
  const self      = node.selfInfo();
  const ft        = node.getFingerTable();

  // 候选集: finger table 中在 (self, target) 区间内的节点
  const candidates: NodeInfo[] = [];
  for (let i = 159; i >= 0; i--) {
    const entry = ft[i];
    if (entry.status === "failed" || !entry.valid) continue;
    if (inRange(entry.node.node_id, self.node_id, targetId, false, false)) {
      candidates.push(entry.node);
    }
  }

  if (candidates.length === 0) return self;

  // 按评分排序, 取最高分
  candidates.sort((a, b) => computeScore(node, b, targetId) - computeScore(node, a, targetId));
  return candidates[0];
}

// — findSuccessorIterative(): 迭代循环, 含路由缓存、环路检测 —————
export async function findSuccessorIterative(
  node: ChordNode,
  targetId: string,
  maxHops: number
): Promise<NodeInfo> {
  // 1. 路由缓存命中
  const cached = node.routingCache.lookup(targetId);
  if (cached) return cached;

```

```

// 2. 本地快速判断
const local = localFindSuccessor(node, targetId);
if (local) {
    node.routingCache.store(targetId, local, node.selfInfo().node_id, local.node_id);
    return local;
}

// 3. 迭代查找
let current      = node.selfInfo();
const visited    = new Set<string>();
let hops         = 0;

while (hops < maxHops) {
    // 环路检测
    if (visited.has(current.node_id)) {
        throw new Error(`Routing loop detected at ${current.node_id} after ${hops} hops`);
    }
    visited.add(current.node_id);
    hops++;

    // 向 current 查询
    let resp: Response;
    try {
        resp = await node.rpcFetch(current.uri + "/chord/find-successor", {
            method: "POST",
            body:    JSON.stringify({ target_id: targetId }),
            headers: { "Content-Type": "application/json" },
        });
    } catch {
        // 节点失联 → 标记失败, 退出
        node.markNodeFailed(current);
        throw new Error(`Node unreachable: ${current.uri}`);
    }

    if (!resp.ok) throw new Error(`find-successor HTTP ${resp.status}`);

    const body = await resp.json<{ found: boolean; successor?: NodeInfo; next_hop?: NodeInfo }>();

    if (body.found && body.successor) {
        const result = body.successor;
        node.routingCache.store(targetId, result, current.node_id, result.node_id);
        return result;
    }

    if (body.next_hop) {
        current = body.next_hop;
    } else {
        throw new Error("Invalid find-successor response: no found and no next_hop");
    }
}

throw new Error(`find-successor exceeded maxHops=${maxHops}`);
}

```

第 9 章 v2.0 身份验证：Web Crypto API

9.1 crypto.ts — Ed25519 / SHA 封装

```
// src/auth/crypto.ts
// Web Crypto API 封装，仅使用原生 SubtleCrypto，无第三方依赖

// — Ed25519 密钥导入 —————
export async function importPrivateKey(base64url: string): Promise<CryptoKey> {
  const raw = base64urlToBytes(base64url);
  // Ed25519 私钥为 32 字节原始格式
  return crypto.subtle.importKey(
    "raw",
    raw,
    { name: "Ed25519" },
    false,
    ["sign"]
  );
}

export async function importPublicKey(base64url: string): Promise<CryptoKey> {
  const raw = base64urlToBytes(base64url);
  return crypto.subtle.importKey(
    "raw",
    raw,
    { name: "Ed25519" },
    true,
    ["verify"]
  );
}

// — 签名 / 验签 —————
export async function signEd25519(
  key: CryptoKey,
  message: BufferSource
): Promise<string> {
  const sig = await crypto.subtle.sign("Ed25519", key, message);
  return bytesToBase64url(new Uint8Array(sig));
}

export async function verifyEd25519(
  key: CryptoKey,
  signature: string,
  message: BufferSource
): Promise<boolean> {
  const sigBytes = base64urlToBytes(signature);
  return crypto.subtle.verify("Ed25519", key, sigBytes, message);
}

// — 哈希 —————
export async function sha256Hex(input: string): Promise<string> {
  const encoded = new TextEncoder().encode(input);
  const hash = await crypto.subtle.digest("SHA-256", encoded);
  return Array.from(new Uint8Array(hash))
    .map(b => b.toString(16).padStart(2, "0"))
    .join("");
}
```

```

    .join("");
}

export async function sha1Hex(input: string): Promise<string> {
    const encoded = new TextEncoder().encode(input);
    const hash = await crypto.subtle.digest("SHA-1", encoded);
    return Array.from(new Uint8Array(hash))
        .map(b => b.toString(16).padStart(2, "0"))
        .join("");
}

// — Base64url 工具 —————
export function base64urlToBytes(b64: string): Uint8Array {
    const padded = b64.replace(/-/g, "+").replace(/_/g, "/")
        + "=".repeat((4 - b64.length % 4) % 4);
    const binary = atob(padded);
    return Uint8Array.from(binary, c => c.charCodeAt(0));
}

export function bytesToBase64url(bytes: Uint8Array): string {
    return btoa(String.fromCharCode(...bytes))
        .replace(/\+/g, "-")
        .replace(/\//g, "_")
        .replace(/=/g, "");
}

```

9.2 signer.ts — 请求签名生成

```

// src/auth/signer.ts
// 签名消息规范 v2.0 §4.2

import type { Env } from "../index";
import { importPrivateKey, signEd25519 } from "../crypto";

export class AuthSigner {
    private constructor(
        private readonly privateKey: CryptoKey,
        private readonly nodeId: string,
        private readonly certificate: string
    ) {}

    static async create(env: Env): Promise<AuthSigner> {
        const privKey = await importPrivateKey(env.NODE_PRIVATE_KEY_BASE64);
        const cert = JSON.parse(env.NODE_CERTIFICATE_JSON);
        return new AuthSigner(privKey, cert.node_id, env.NODE_CERTIFICATE_JSON);
    }

    // signRequest(): 生成签名 Headers
    async signRequest(
        method: string,
        url: string,
        body: string | null
    ): Promise<Record<string, string>> {
        const timestamp = Math.floor(Date.now() / 1000).toString();
        const nonce = crypto.randomUUID().replace(/-/g, "");

```

```

// 签名消息: METHOD\nURL\nTIMESTAMP\nNONCE[\nSHA256(body)]
const parts = [method.toUpperCase(), url, timestamp, nonce];
if (body) {
  const bodyHash = await sha256Hex(body);
  parts.push(bodyHash);
}
const message = parts.join("\n");
const msgBytes = new TextEncoder().encode(message);
const signature = await signEd25519(this.privateKey, msgBytes);

    .map(b => b.toString(16).padStart(2, "0"))
    .join("");
}

```

第 10 章 v3.0 优化实现

10.1 LRU 路由缓存 (src/cache/routing-cache.ts)

RoutingCache 是 v3.0 的核心性能优化，支持精确匹配和区间命中两种查找模式，显著减少 find_successor 的网络跳数。

```
// src/cache/routing-cache.ts

import type { NodeInfo } from "../chord/types";
import { hexToBigInt } from "../chord/ring";

interface CacheEntry {
  targetId: string;
  resultNode: NodeInfo;
  cachedAt: number; // Unix ms
  intervalStart: string | undefined; // predecessor.id (exclusive)
  intervalEnd: string | undefined; // resultNode.id (inclusive)
}

const TTL_MS = 60_000; // 1 分钟

export class RoutingCache {
  private readonly capacity: number;
  // 使用 Map 维护 LRU 顺序 (插入顺序 = 最近访问在末尾)
  private readonly map: Map<string, CacheEntry> = new Map();
  // 区间索引: resultNode.id → CacheEntry[]
  private readonly intervalIndex: Map<string, CacheEntry[]> = new Map();

  constructor(capacity = 256) {
    this.capacity = capacity;
  }

  // lookup(): 精确匹配 + 区间命中
  lookup(targetId: string): NodeInfo | null {
    const now = Date.now();

    // 1. 精确匹配
    const exact = this.map.get(targetId);
    if (exact) {
      if (now - exact.cachedAt > TTL_MS) {
        this.evict(targetId);
        return null;
      }
      this.touch(targetId, exact);
      return exact.resultNode;
    }

    // 2. 区间命中: 遍历区间索引, 检查 targetId 是否在 (start, end] 内
    const targetBig = hexToBigInt(targetId);
    for (const [endId, entries] of this.intervalIndex) {
      for (const entry of entries) {
        if (!entry.intervalStart || !entry.intervalEnd) continue;
```

```

    if (now - entry.cachedAt > TTL_MS) {
        this.evict(entry.targetId);
        continue;
    }

    const startBig = hexToBigInt(entry.intervalStart);
    const endBig   = hexToBigInt(entry.intervalEnd);

    let hit = false;
    if (startBig < endBig) {
        hit = targetBig > startBig && targetBig <= endBig;
    } else {
        // 跨越 0 点
        hit = targetBig > startBig || targetBig <= endBig;
    }

    if (hit) {
        return entry.resultNode;
    }
}

return null;
}

// store(): LRU 驱逐 + 区间索引维护
store(
    targetId:      string,
    resultNode:    NodeInfo,
    intervalStart?: string,
    intervalEnd?:  string
): void {
    // LRU 驱逐
    if (this.map.size >= this.capacity && !this.map.has(targetId)) {
        const oldestKey = this.map.keys().next().value;
        if (oldestKey) this.evict(oldestKey);
    }

    const entry: CacheEntry = {
        targetId, resultNode,
        cachedAt: Date.now(),
        intervalStart, intervalEnd,
    };

    this.map.delete(targetId); // 先删，确保重新插到末尾
    this.map.set(targetId, entry);

    // 维护区间索引
    if (intervalEnd) {
        if (!this.intervalIndex.has(intervalEnd)) {
            this.intervalIndex.set(intervalEnd, []);
        }
        this.intervalIndex.get(intervalEnd)!.push(entry);
    }
}

private touch(key: string, entry: CacheEntry): void {
    this.map.delete(key);

```

```
        this.map.set(key, entry);
    }

    private evict(key: string): void {
        const entry = this.map.get(key);
        if (entry?.intervalEnd) {
            const list = this.intervalIndex.get(entry.intervalEnd);
            if (list) {
                const idx = list.indexOf(entry);
                if (idx !== -1) list.splice(idx, 1);
                if (list.length === 0) this.intervalIndex.delete(entry.intervalEnd);
            }
        }
        this.map.delete(key);
    }
}
```

第 11 章 Tracker Client 实现

实现位置： `src/tracker/tracker-client.ts`

功能职责： TrackerClient 负责向 Tracker 注册节点、获取种子节点、上报心跳、拉取 CRL。具体职责包括：

- 注册（register）：节点 Join 时向 Tracker 上报自身 NodeInfo 与证书
- 获取种子（getSeeds）：从 Tracker 拉取已知活跃节点列表，用于 Join 引导
- 心跳（heartbeat）：周期性上报存活状态
- 注销（deregister）：Graceful Leave 时从 Tracker 移除自身
- 拉取 CRL（fetchCRL）：获取最新证书吊销列表

(详细实现见配套实现文档)

第 12 章 DO Storage 持久化策略

持久化策略概述：

- **写入时机：** 状态变更后立即持久化（`persistState()`），保证 DO 驱逐后可完整恢复
- **批量写入优化：** 单次 `storage.put()` 写入整个 `PersistedState` JSON，避免多次 I/O
- **冷启动恢复流程：** `blockConcurrencyWhile(initialize)` 确保首个请求到达前状态已恢复完毕
- **内存缓存重建：** `nonceCache`、`certCache`、`routingCache`、`rttCache` 均为内存态，DO 驱逐后按需重建，协议自身容错

(详细实现见配套实现文档)

第 13 章 Graceful Leave：适配 API 触发

触发方式：通过 `POST /admin/leave` 接口触发

执行流程：

- 1. 状态转移：ACTIVE → LEAVING
- 2. 停止接受新 Chord 协议请求（返回 503）
- 3. 向前驱通知后继变更
- 4. 向后继传递前驱指针
- 5. 从 Tracker 注销
- 6. 状态转移：LEAVING → INITIALIZING，清空持久化状态

(详细实现见配套实现文档)

第 14 章 配置管理：Secrets 与环境变量

14.1 配置分类

配置项	存储方式	说明
NODE_PRIVATE_KEY_BASE64	wrangler secret put	Ed25519 私钥，32 字节，base64url 编码。不可写入 wrangler.toml
NODE_CERTIFICATE_JSON	wrangler secret put	完整 JSON 证书字符串，由 CA 签发
CA_PUBLIC_KEY_BASE64	wrangler secret put	CA 公钥，32 字节，base64url 编码，用于验证其他节点证书
MANUAL_SEEDS	wrangler secret put	JSON 数组字符串，手动指定种子节点，如 <code>['"https://node-b..."']</code>
NODE_URI	wrangler.toml [vars]	本节点的 HTTPS URI，用于计算 node_id
NODE_REGION	wrangler.toml [vars]	地域标识，用于 v3.0 延迟感知路由评分（Region 亲和权重 0.1）
TRACKER_URL	wrangler.toml [vars]	Tracker 服务地址

配置项	存储方式	说明
AUTH_ENABLED	wrangler.toml [vars]	"true" 启用 v2.0 身份验证，"false" 跳过（测试用）

 安全提示

所有敏感配置（私钥、证书、CA 公钥、手动种子）必须通过 `wrangler secret put` 注入，**绝对不能**写入 `wrangler.toml` 或提交至版本控制系统。Secrets 在 Cloudflare 后端加密存储，仅在运行时通过 `env` 对象注入。

(详细配置校验与运行时读取逻辑见配套实现文档)

第 15 章 Go → TypeScript 逐项映射对照表

Go 实现	TypeScript / CF Workers 对应	说明
<code>sync.RWMutex</code>	无需——DO 单线程串行执行	DO 天然消除所有并发锁
<code>time.Ticker + goroutine</code>	DO Alarm (<code>ctx.storage.setAlarm()</code>)	Alarm 自我续命形成永久循环
<code>goroutine</code> （并发任务）	<code>Promise.allSettled(tasks)</code>	<code>fixFingersBatch</code> 等并行操作
<code>context.Context + 超时</code>	<code>AbortController + setTimeout</code>	HTTP 请求超时控制
<code>crypto/ed25519</code>	<code>crypto.subtle</code> （Ed25519）	Web Crypto API，原生支持
<code>crypto/sha1</code>	<code>crypto.subtle.digest("SHA-1")</code>	计算节点 ID
<code>math/big.Int</code> （160-bit 环运算）	<code>BigInt</code> （原生）	JavaScript 原生大整数，无需依赖库
<code>net/http</code> 服务器	<code>DO fetch()</code> handler	请求在 DO 内串行处理
<code>net/http</code> 客户端	全局 <code>fetch()</code> （带签名）	通过 <code>rpcFetch</code> 封装自动签名
<code>os.Getenv()</code>	<code>env.VAR_NAME</code>	通过 <code>wrangler.toml [vars]</code> 或 Secrets 注入
内存状态（struct 字段）	DO 实例属性（ <code>private</code> ）	热路径，DO 存活期间常驻内存
文件持久化 / 数据库	DO Storage（SQLite）	<code>ctx.storage.get/put</code> ，冷启动恢复
<code>log.Printf</code>	<code>console.log</code>	输出到 Cloudflare Workers 日志流

Go 实现	TypeScript / CF Workers 对应	说明
二进制部署	wrangler deploy	每次 deploy 对应一个节点版本

(完整逐函数映射对照表见配套实现文档)

第 16 章 已知约束与边缘情况

16.1 已知约束汇总

约束项	影响	缓解措施
免费计划 DO CPU 30 ms 限制	Ed25519 验签 + 并发 fix_fingers 超限	升级 Workers Paid (\$5/月)，CPU 上限提升至 30 s
免费计划 subrequest 50 次 / 调用	fixFingersBatch(k=8) 并发受限	付费计划 1 000 次；或减小批量大小
DO 驱逐后内存缓存丢失	nonceCache、certCache、routingCache、rttCache 重置	协议本身容错；冷启动后缓存自动重建
DO 驱逐 nonce 缓存丢失	重放窗口期内理论上可重放	时间窗口 (± 5 min) 限制重放范围；可接受的学习用途风险
单 Worker deployment = 单节点	多节点需多次 wrangler deploy	设计约束，符合 Chord 去中心化部署模型
同一 workers.dev 子域名冲突	测试环境两个节点共用同一 worker 名时 node_id 冲突	每个节点使用唯一 name (wrangler.toml) 或自定义域名
DO Alarm 精度	Alarm 实际触发时间可能比预期晚数秒	维护周期对秒级抖动不敏感，可接受
BigInt 序列化	JSON.stringify 不支持 BigInt	所有 ID 均以 40 位 hex 字符串存储和传输，运算时临时转换
Ed25519 浏览器兼容性	Cloudflare Workers 运行时已全面支持	仅需注意本地测试环境 (Node.js 18+ 支持)

(完整边缘情况分析与测试矩阵见配套实现文档)
